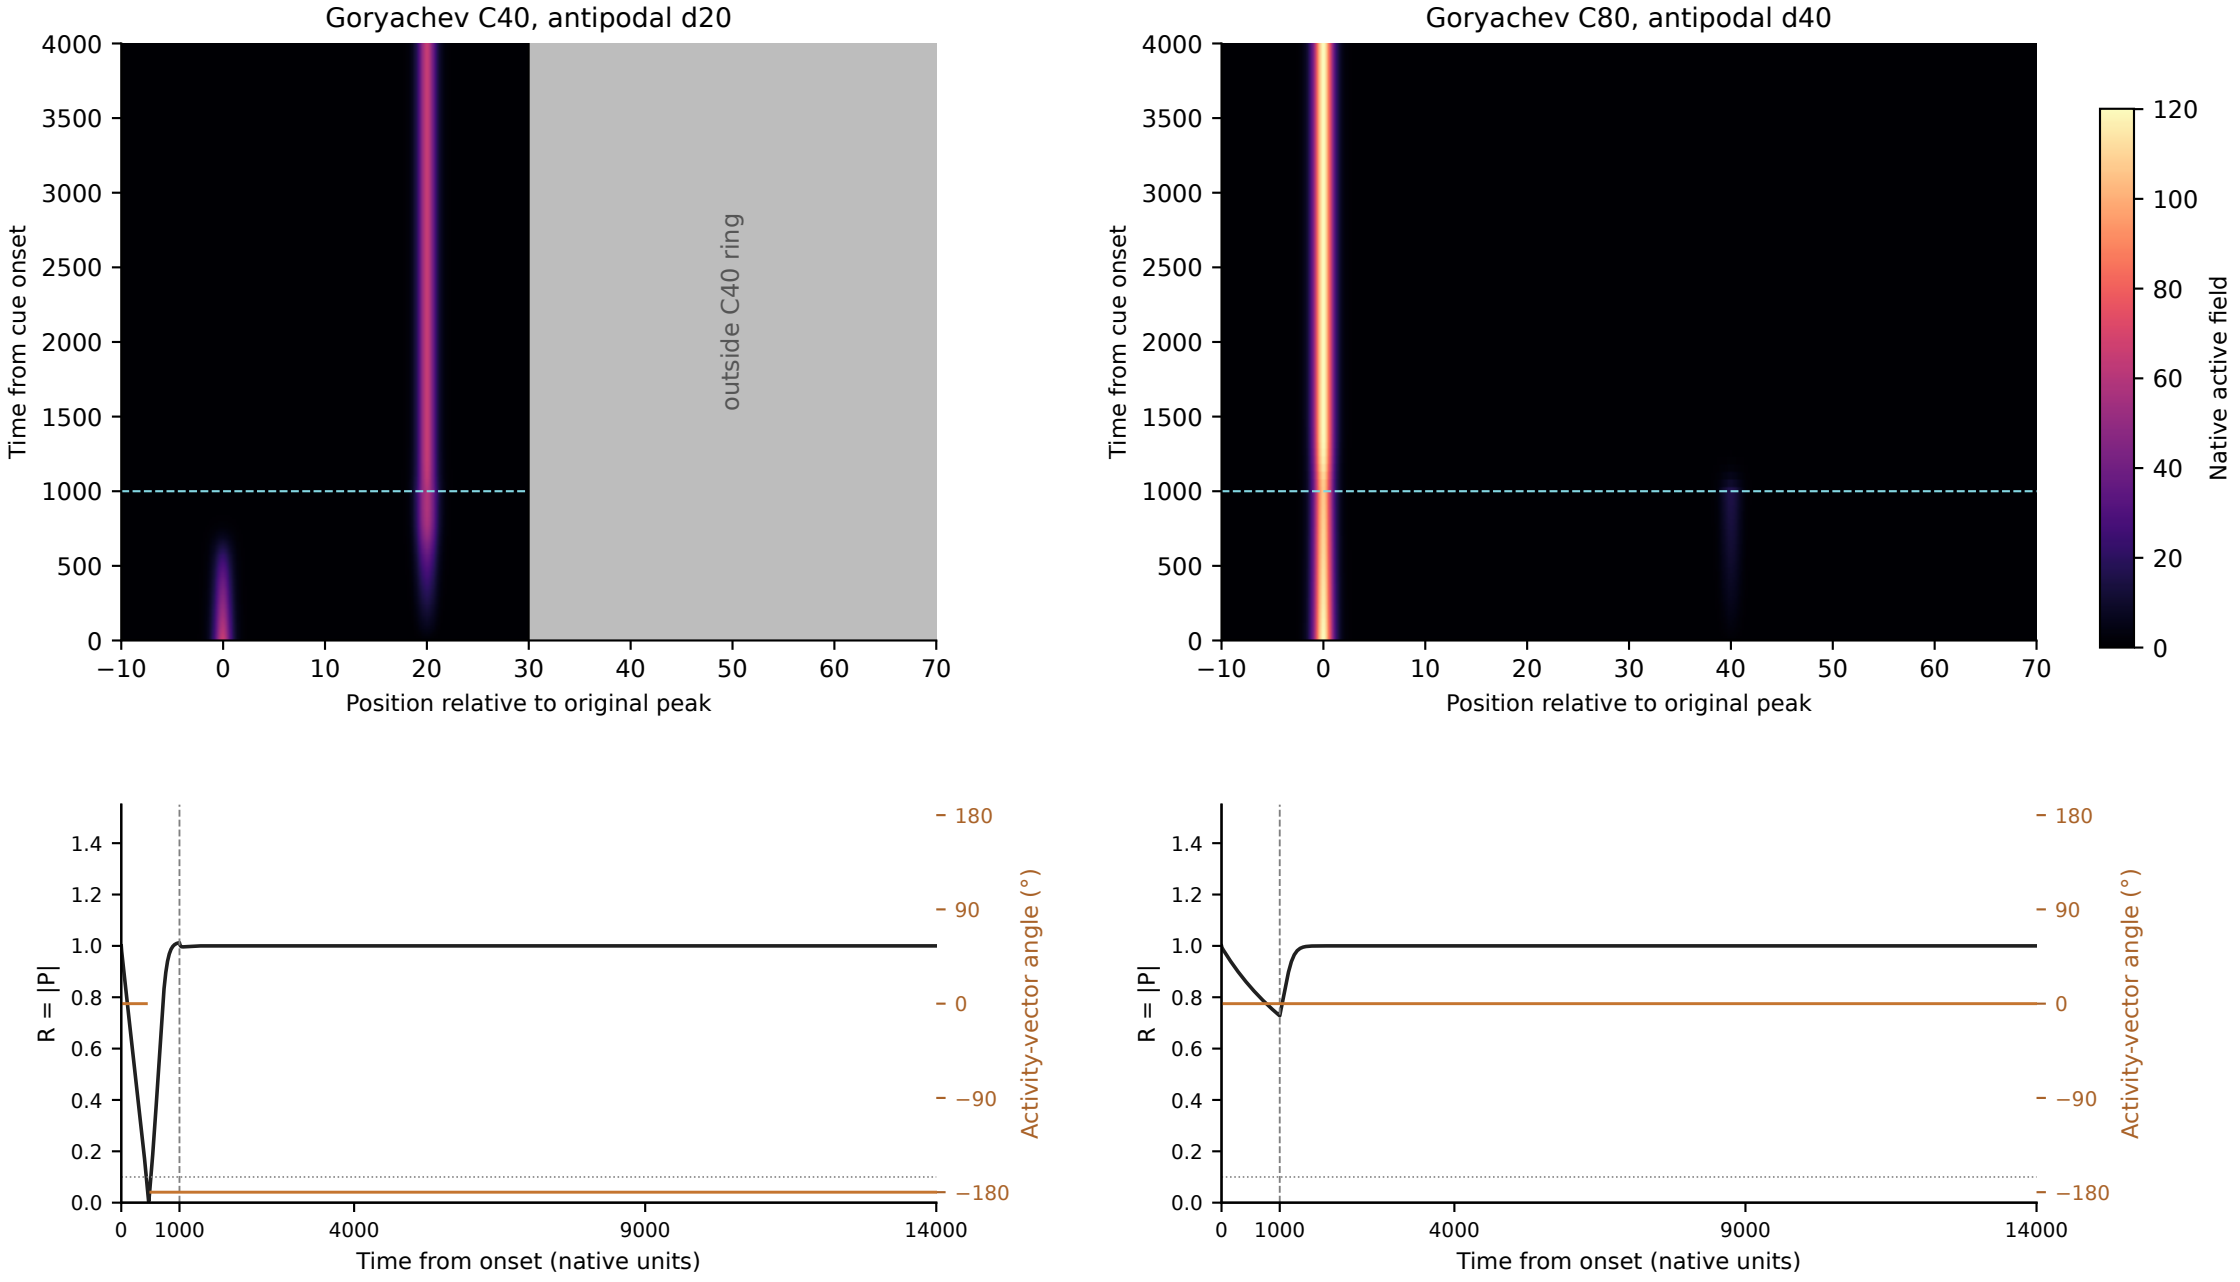
Geographically different single-peak endpoints: replacement and retained old activity



Both cues are antipodal and use the same native input law, local width and 1000 on / 13000 off protocol. Size, material, architecture and both routes change together. The C80 full history retains original-region activity while the challenger transient vanishes; C40 relocates activity toward the cue. No pure distance mechanism is isolated. Top: linear 0–4000 display, exact native samples, periodic cut−10. Bottom: same-source activity magnitude/angle through 14000; direction withheld forR < 0.1.
