Ring counterparts and local responses: native correspondence, input gain and active-loss recovery

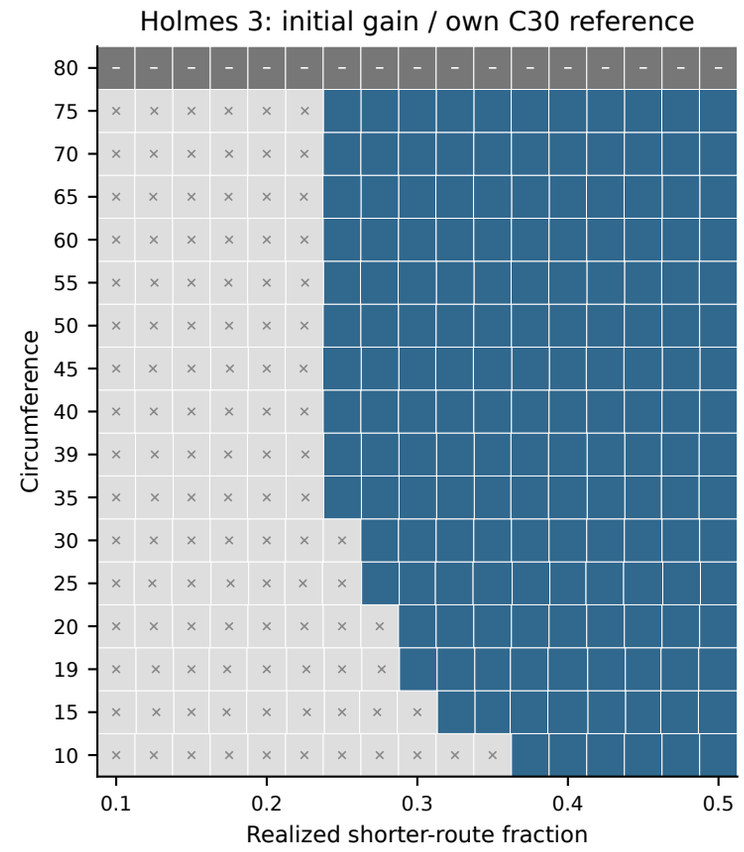

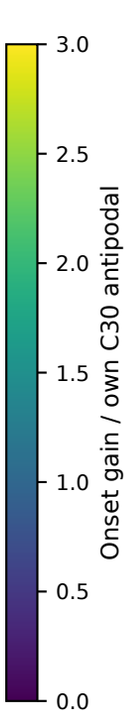

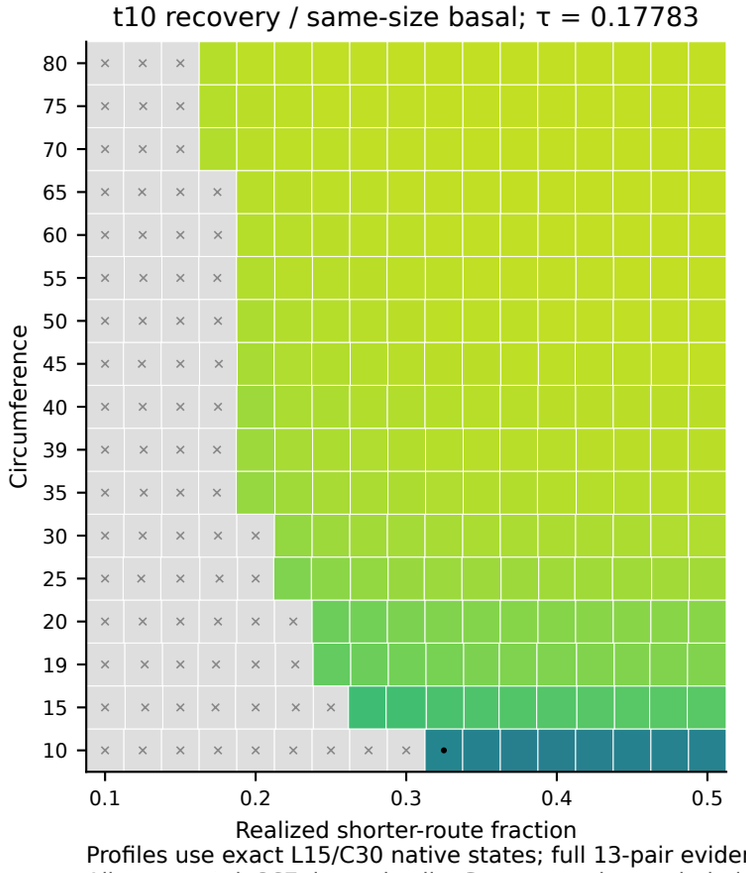

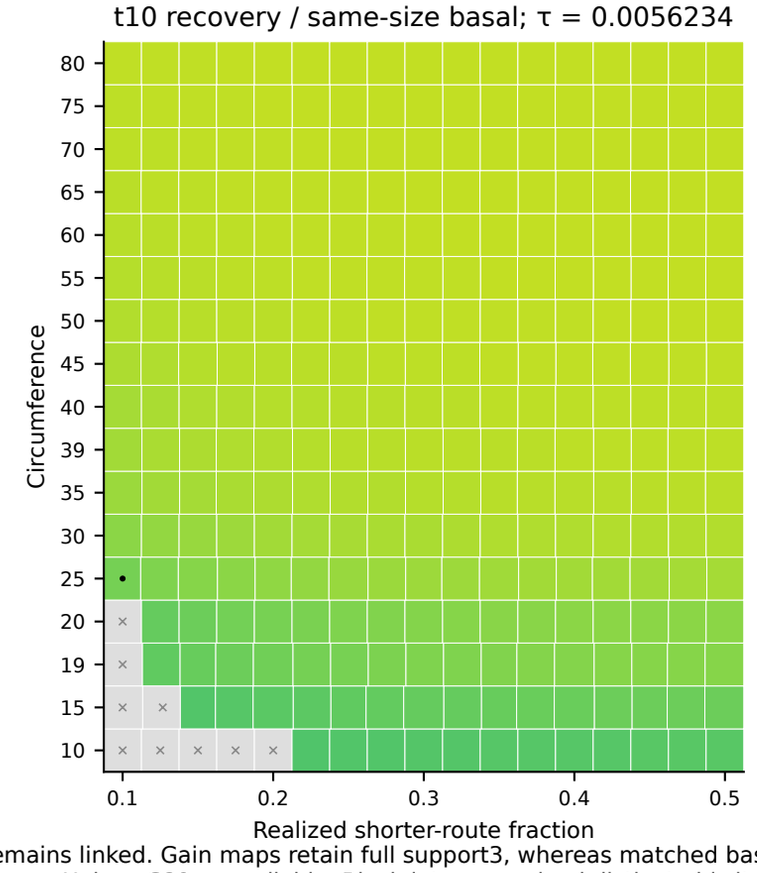

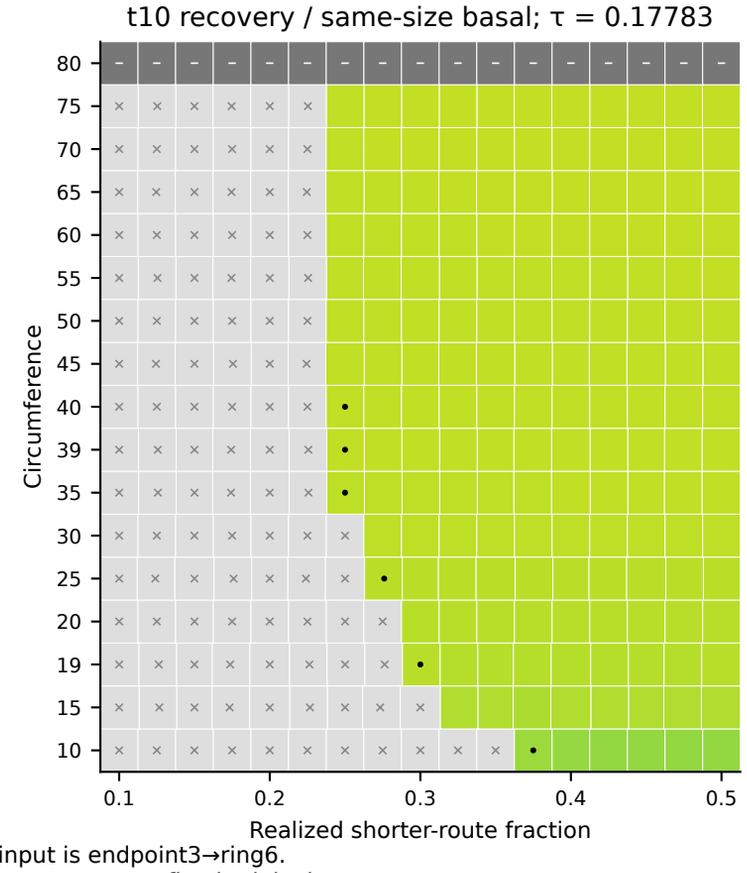

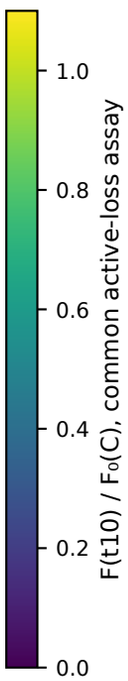

Profiles use exact L15/C30 native states; full 13-pair evidence remains linked. Gain maps retain full support3, whereas matched baseline input is endpoint3→ring6.
All maps retain867planned cells. Gray×: overlap excluded; darkgray: HolmesC80 unavailable. Blackdot: no resolved distinct old site; response concerns fixed original core.
Recovery removes0.5% of the frozen basal active-excess direction, transfers it to inactive, evolves all fields and compares with sham. Clocks differ across native models.
