Supplement 1 · Length versus finite cue duration

Five models × three tests · exact shared relative-20% basal checkpoint · unchanged scalar gates and recovery

deBelly uses fresh corrected preparations and independent endpoint commands

Orientation gate
Polarity strength within 1%
No passing pulse within tested range
Ineligible preparation (below axis)
Scalar success; native-field flag fails

Fixed width 3
Spring: native width 0.2

Relative width 20%

Constant physical slope

Goryachev

deBelly

Holmes 3

Spring

Shortest passing tested cue duration

Nominal cell length (native units)

Native resting length L0

Both patches use a constant peak across all lengths; Goryachev K=64, peak=6.4. Gradients retain one constant physical slope per model.
Each positive duration restarts the original checkpoint. Full strength adds the 1% reversed initial-polarity band to the orientation gate.
Open markers retain failing field-tail flags. Censoring marks explicit tested limits; missing endpoints break lines. Native times and scales differ.
Data generated 2026-10-08T19:26:33.200718+00:00; producer finished. Every imported and fresh trial passed independent native-array audit.
