How much does the Hosny drift assumption change the fitted contrast?

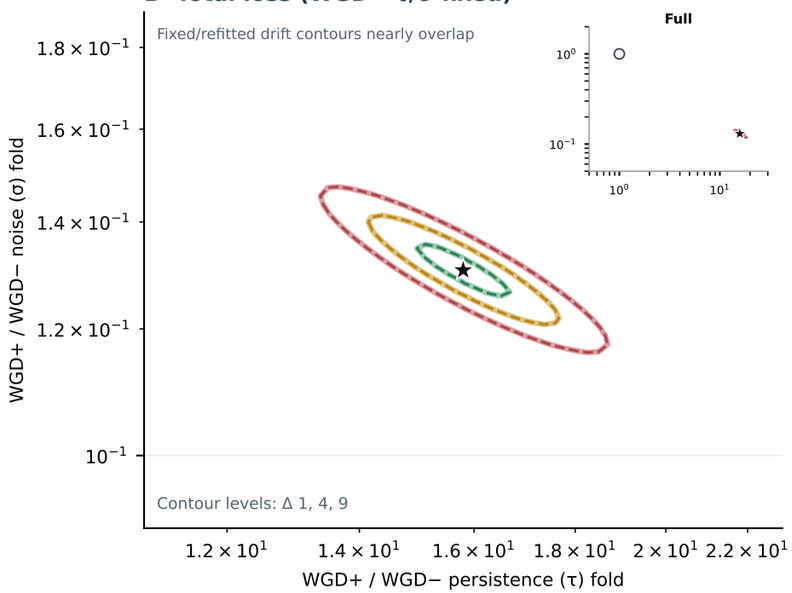

Primary Gaussian OU hierarchy · profile panels reoptimize remaining parameters · Δ values are descriptive fit sensitivity

Hosny drifts fixed · Both Hosny drifts refit · Δ 1 · Δ 4 · Δ 9

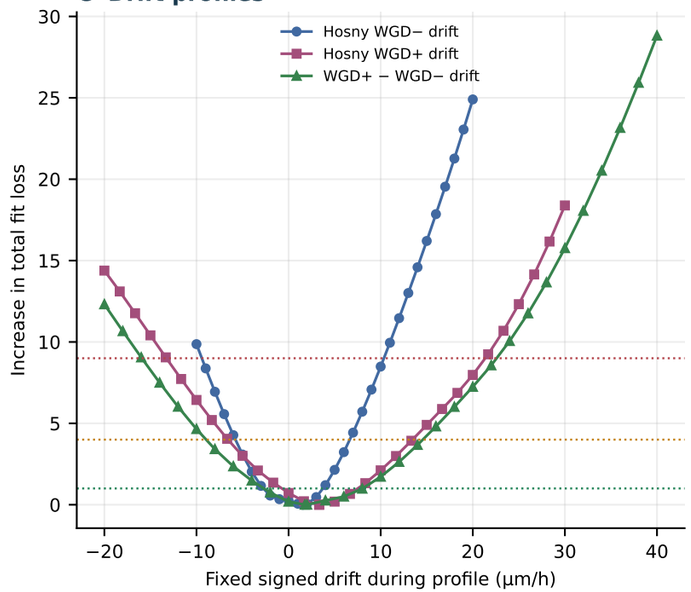

A Data misfit (WGD− τ/σ fixed)

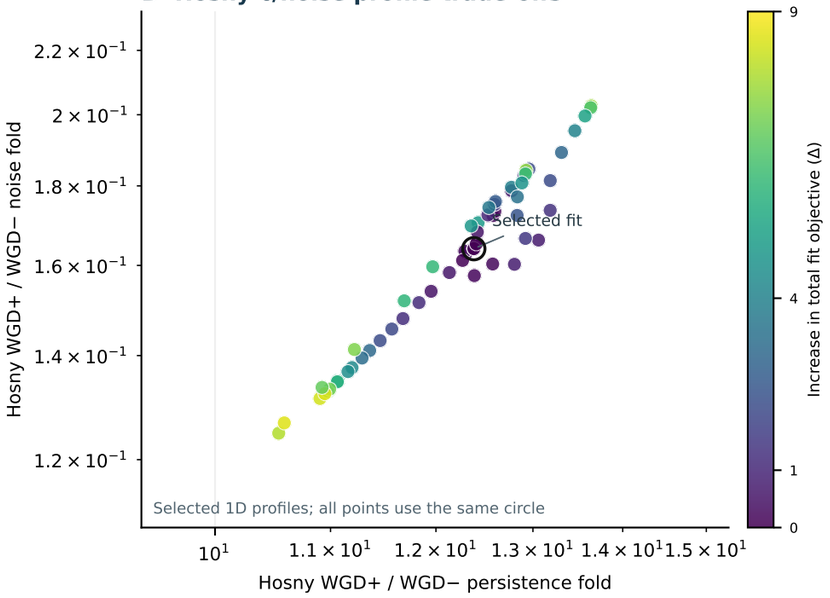

B Total loss (WGD− τ/σ fixed)

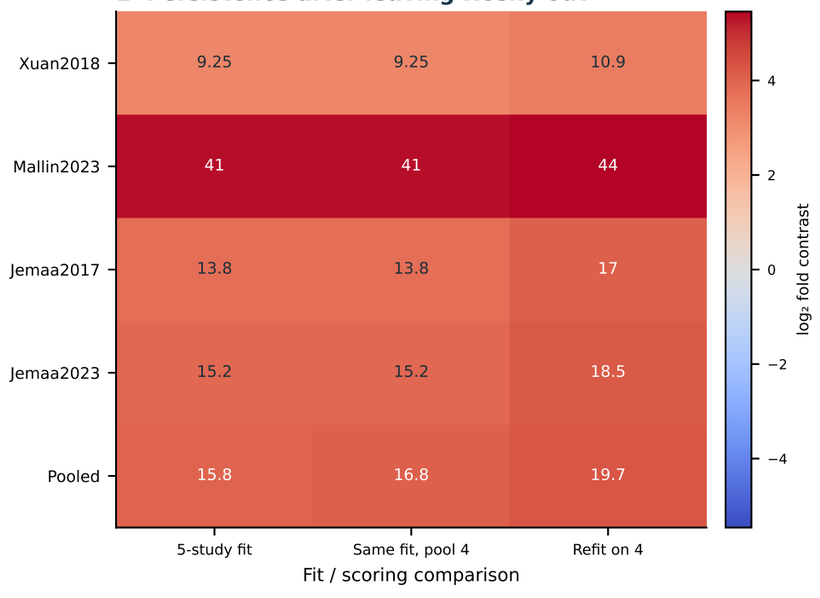

C Drift profiles

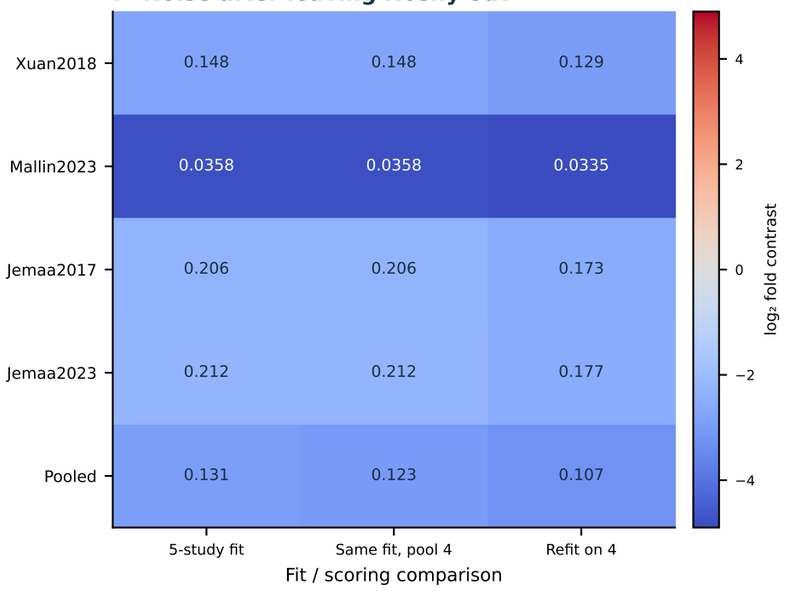

D Hosny τ/noise profile trade-offs

E Persistence after leaving Hosny out

F Noise after leaving Hosny out

Objective is arbitrarily weighted and has no calibrated statistical or biological units; it is not a likelihood. Profile ranges are unions of sampled 1D fits, not joint uncertainty regions. Hosny contributes medians to fitting.
