Distinct finite responses to a local polarity challenge

Requested support 3 and native peak fixed across sizes within each model · 1000 cue units + 13,000 cue-free units

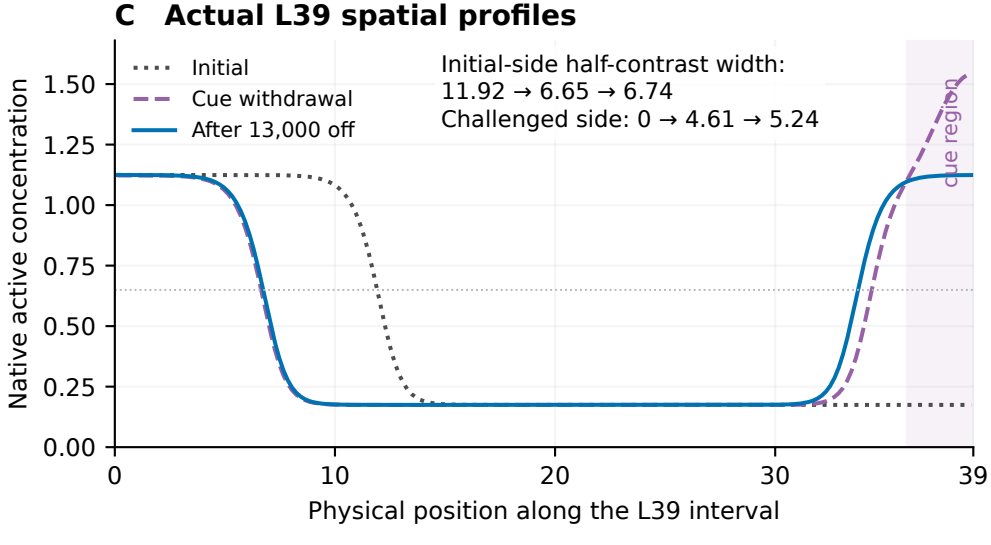

Measured activity in the physical cue region, with an L19 reference; all main histories retain native concentration units.

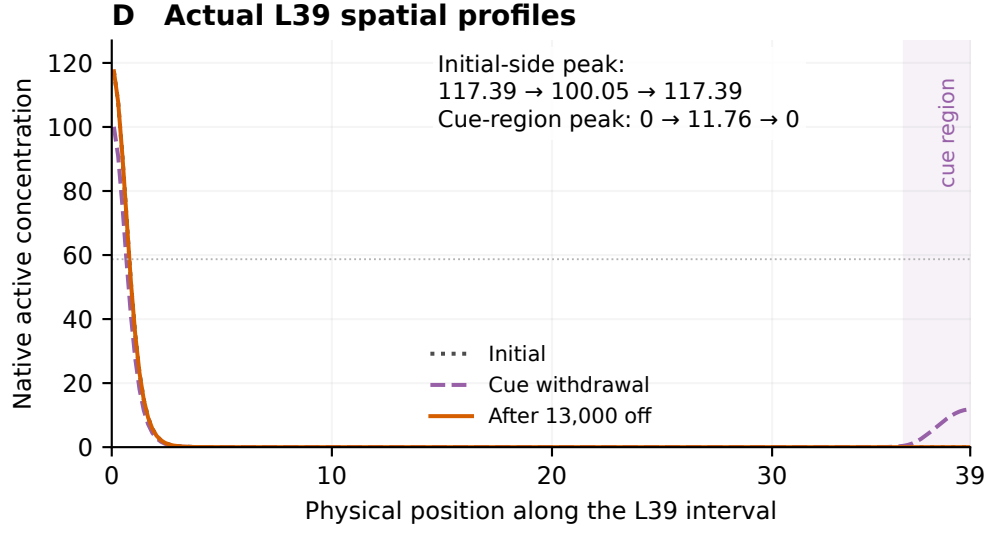

Broader incumbent; two domains retained after withdrawal

Taller pole, lower substrate; weaker challenger, then decay

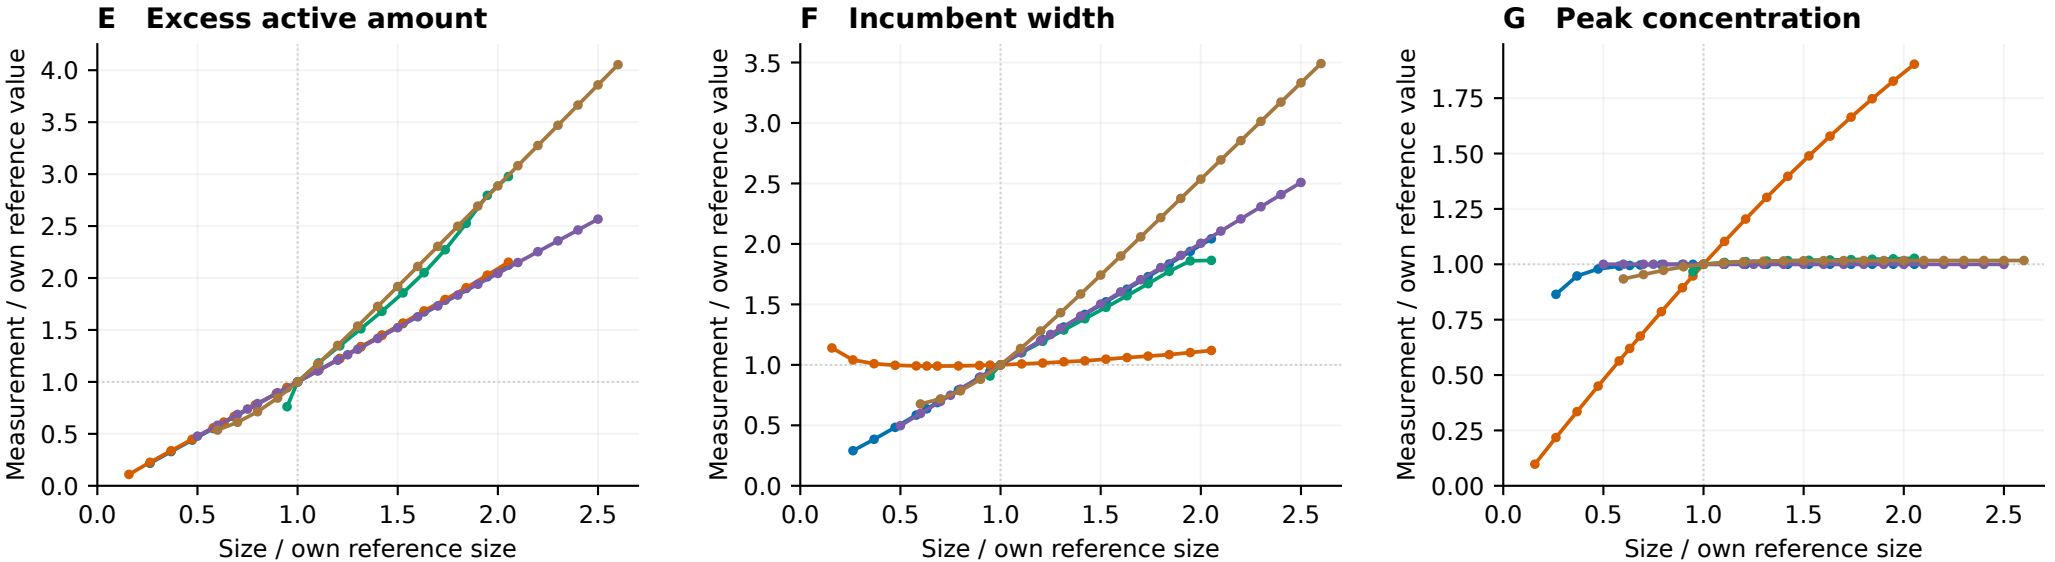

Both native inputs transfer stimulus × inactive into active; finite responses include coupled reaction and transport.

Native peaks: WP 0.1; Goryachev 6.4. These are not matched optical doses or biological clocks.

Widths use each initial half-contrast threshold; zero threshold-defined extent does not mean absent activity. Finite patterns are not tracked site identities or a movement law.

Incumbent material increases through different spatial changes

All 97 eligible basal checkpoints · explicit normalization to each model's own reference · unchanged native measurements

References: L19 for WP/Goryachev/deBelly; L20 for Holmes; resting L_0=1 for Spring.
Amount is excess activity in the connected basal half-contrast core. Spring widths/amounts use its physical domain; deBelly retains nominal solver coordinates.
Thirteen preparation-ineligible sizes are recorded separately, not assigned zero. Original full native-unit organization artwork remains linked.
