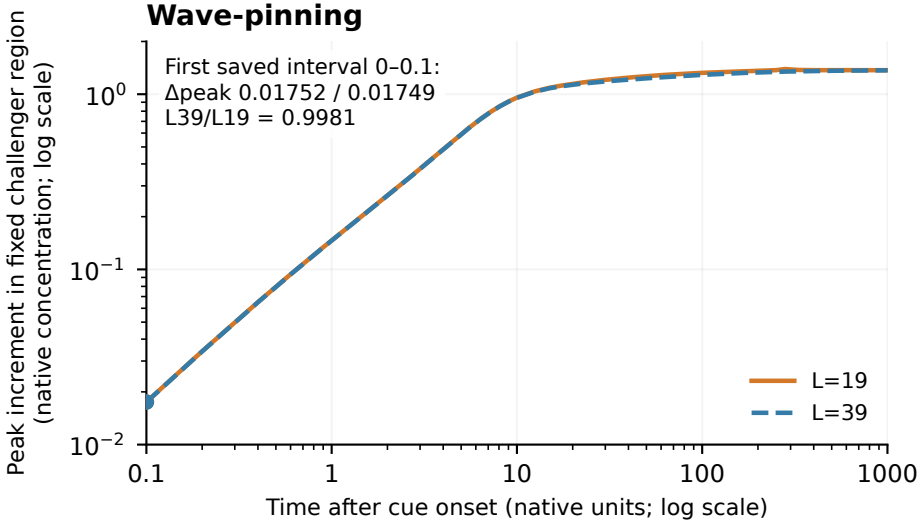
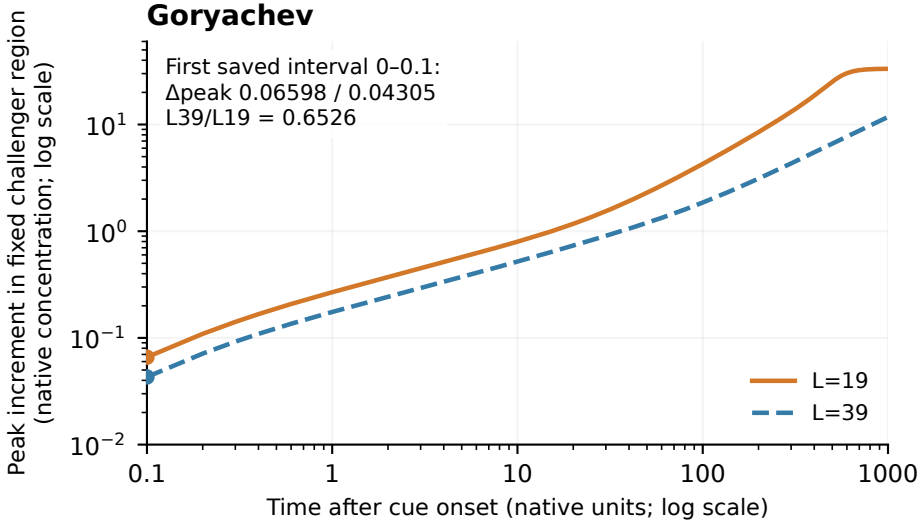
Two measured-response options for discussion

Retained starting contrast: WP mainly widens; Goryachev mainly grows taller. Original all-five artwork is linked unchanged.

A Local excitation → challenger activity

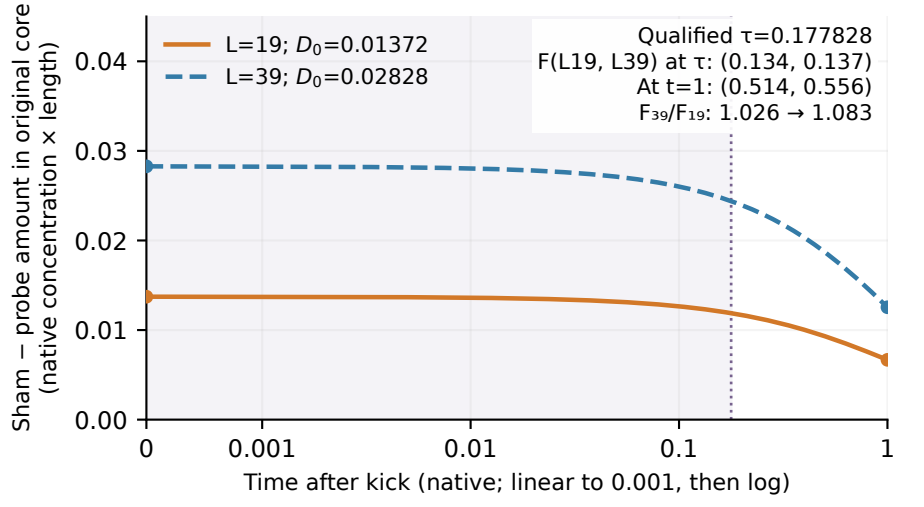
Native source = stimulus × inactive; support 3; peaks WP 0.1 / Goryachev 6.4. One fixed dose per model.

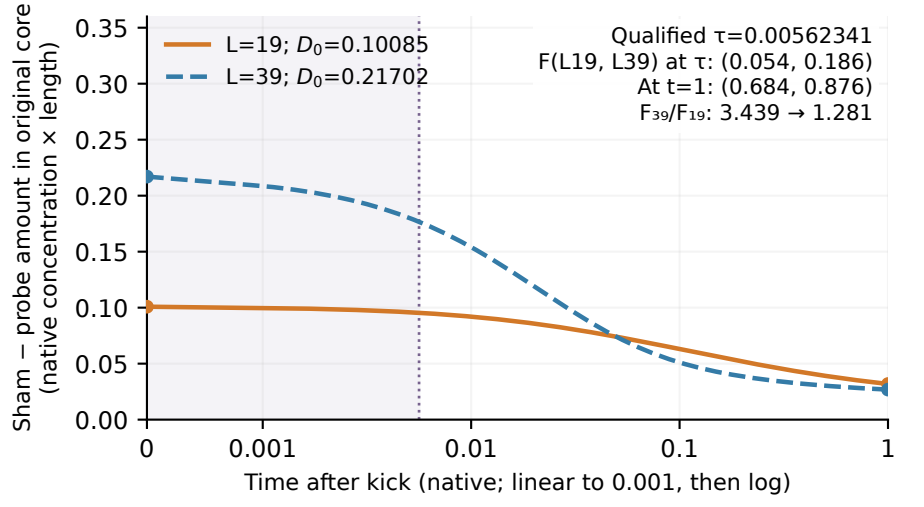




B Incumbent deactivation → original-core deficit and recovery

Instantaneous 0.5% tapered basal-excess direction moves active into inactive; no countercue; paired sham.





B shading marks the previously qualified early estimator window (≤20% restoration); later lines are valid finite-time responses.

Native doses and clocks have no shared optical or reporter calibration. These are conditional readout options, not a replacement Figure 2 layout.
