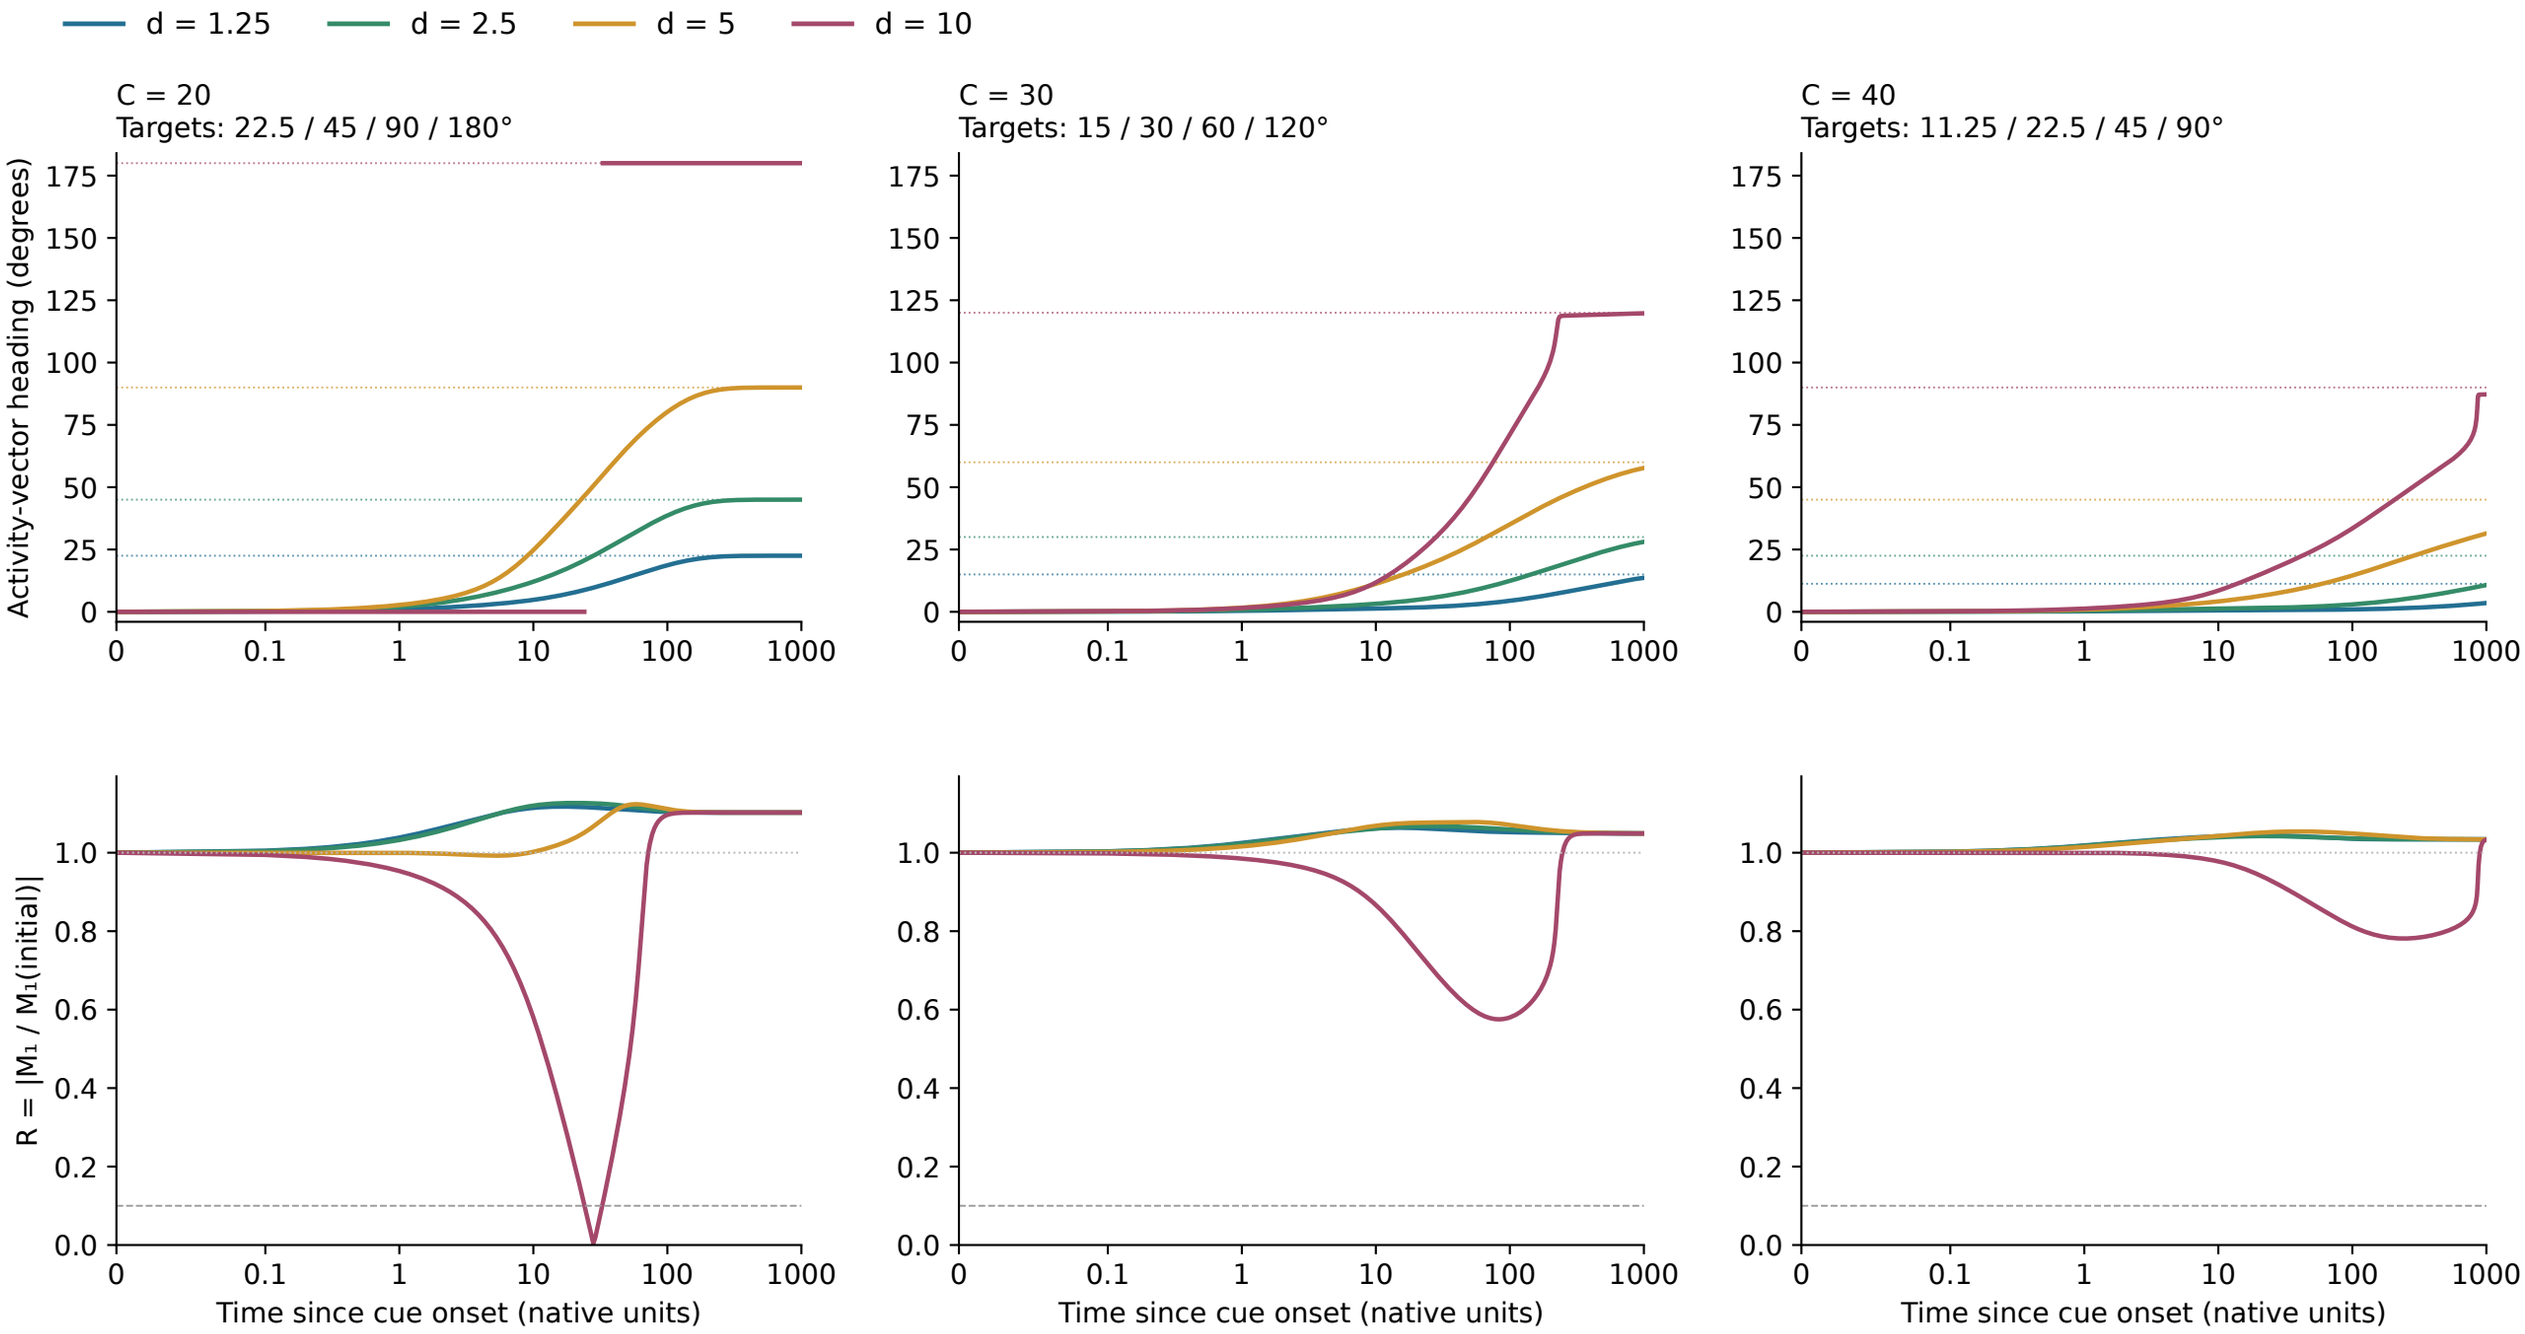
Wave-pinning · Saved cue-on activity-vector histories

Same four initial physical cue offsets, three native sizes. The cue remains on throughout 0–1000; withdrawal is not shown.



Dotted heading lines mark the actual targets. R < 0.1 produces heading gaps; no phase is joined across cancellation.

The smallest-size antipodal heading switch is symmetry-constrained and passes through a weak resultant; it is not a measured finite rapid rotation.

Native clock: linear 0–0.1, logarithmic thereafter. All initial overlaps retained; exact cue-footprint overlap and sample intervals are exported.
