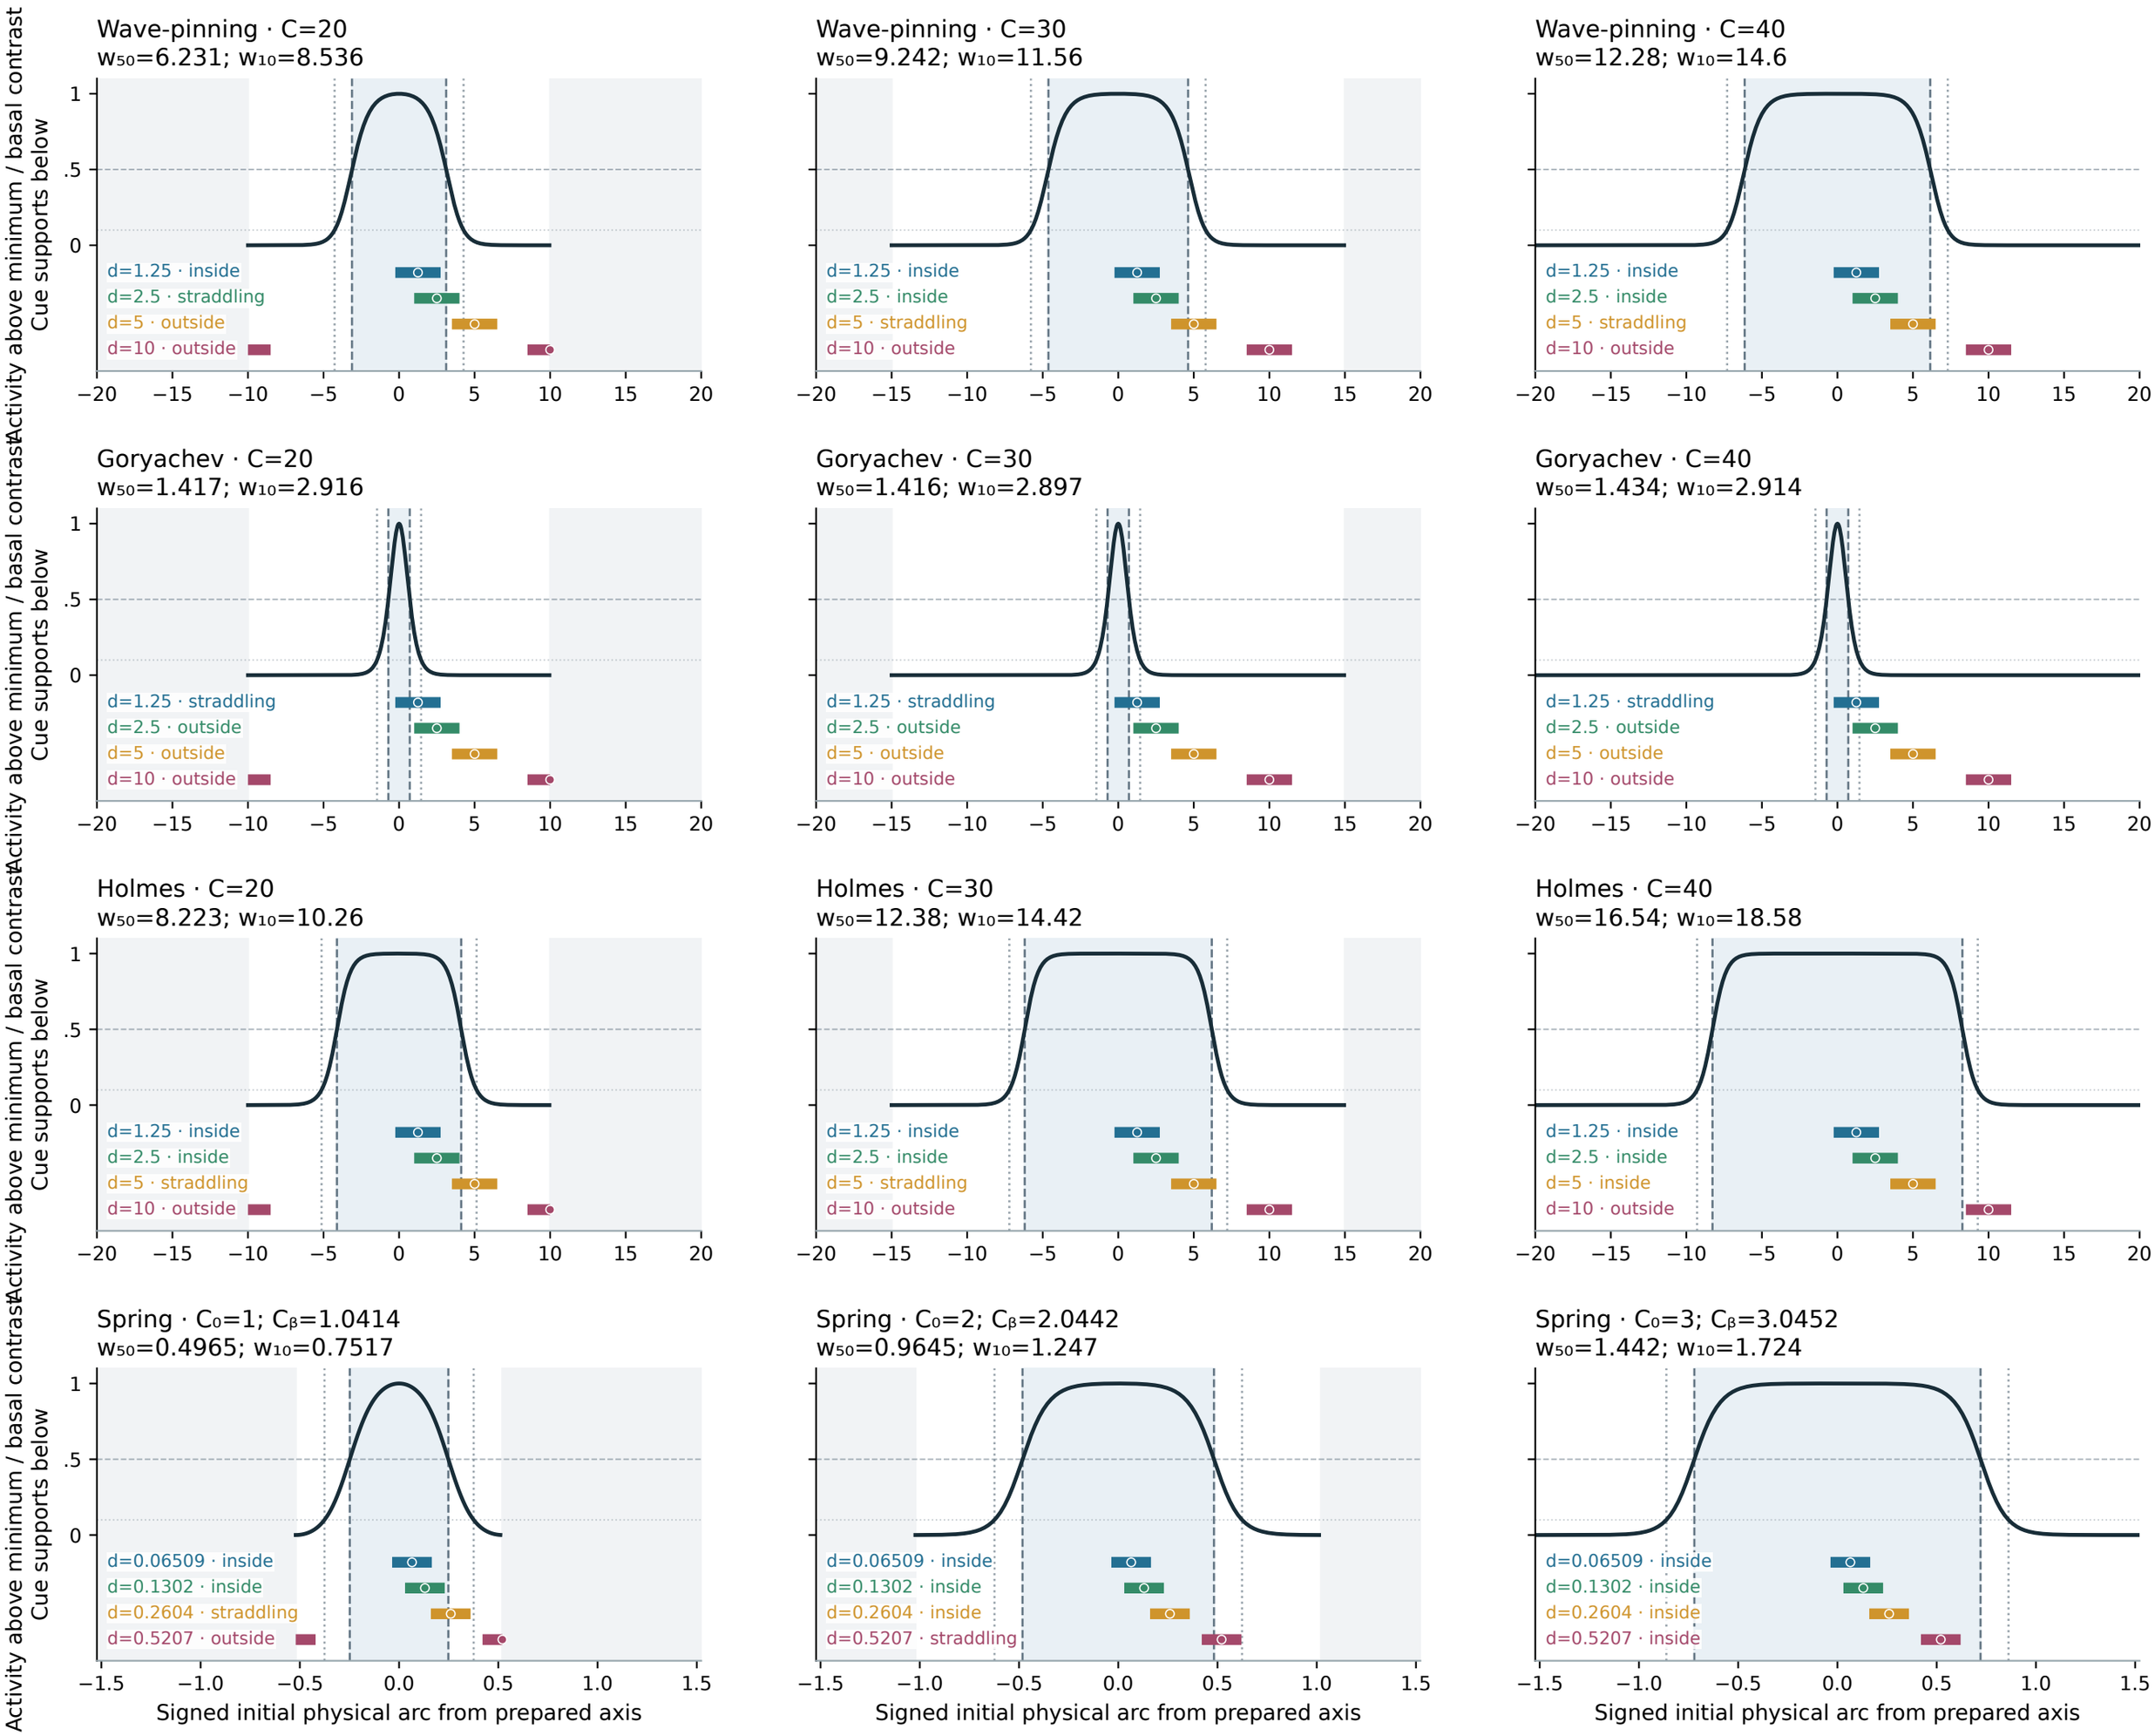
# Where the existing cues fall on the initial incumbent

Same four initial physical offsets at every size; native basals and cue widths remain unchanged.

Black: [u − min(u)] / [max(u) − min(u)]. Dashed edges: 50% contrast; dotted: 10%.



Coloured bars are the full prescribed cue support; dots are continuous cue centres. Bar labels classify support at 50% contrast.

Physical x scale is shared across sizes within each model row. Grey outer areas are beyond the smaller ring; antipodal support wraps.

These operational edges are readouts, not biological boundaries. Initial cue overlap is retained; it does not establish a distinct challenger or site ancestry.
