The same external physical cue, two native incumbent sizes

Wave-pinning · $d_0 = 11$ · full support 3 · coefficient peak 0.1 · held cue T = 1000 · native kinetics and exact basals retained

Every saved native cue-on frame is shown. Dashed: initial 10%-contrast edges. White/orange: cue centre/support. Grey padding is outside the shorter domain.
Time is linear to 0.1 then log. Complex axes have equal scale; dashed circle is R = 1; squares mark withdrawal and numbers give actual native times.
Physical cue arc is matched; native target angle and incumbent architecture differ. These are activity patterns and resultants, not site ancestry or cell movement.
