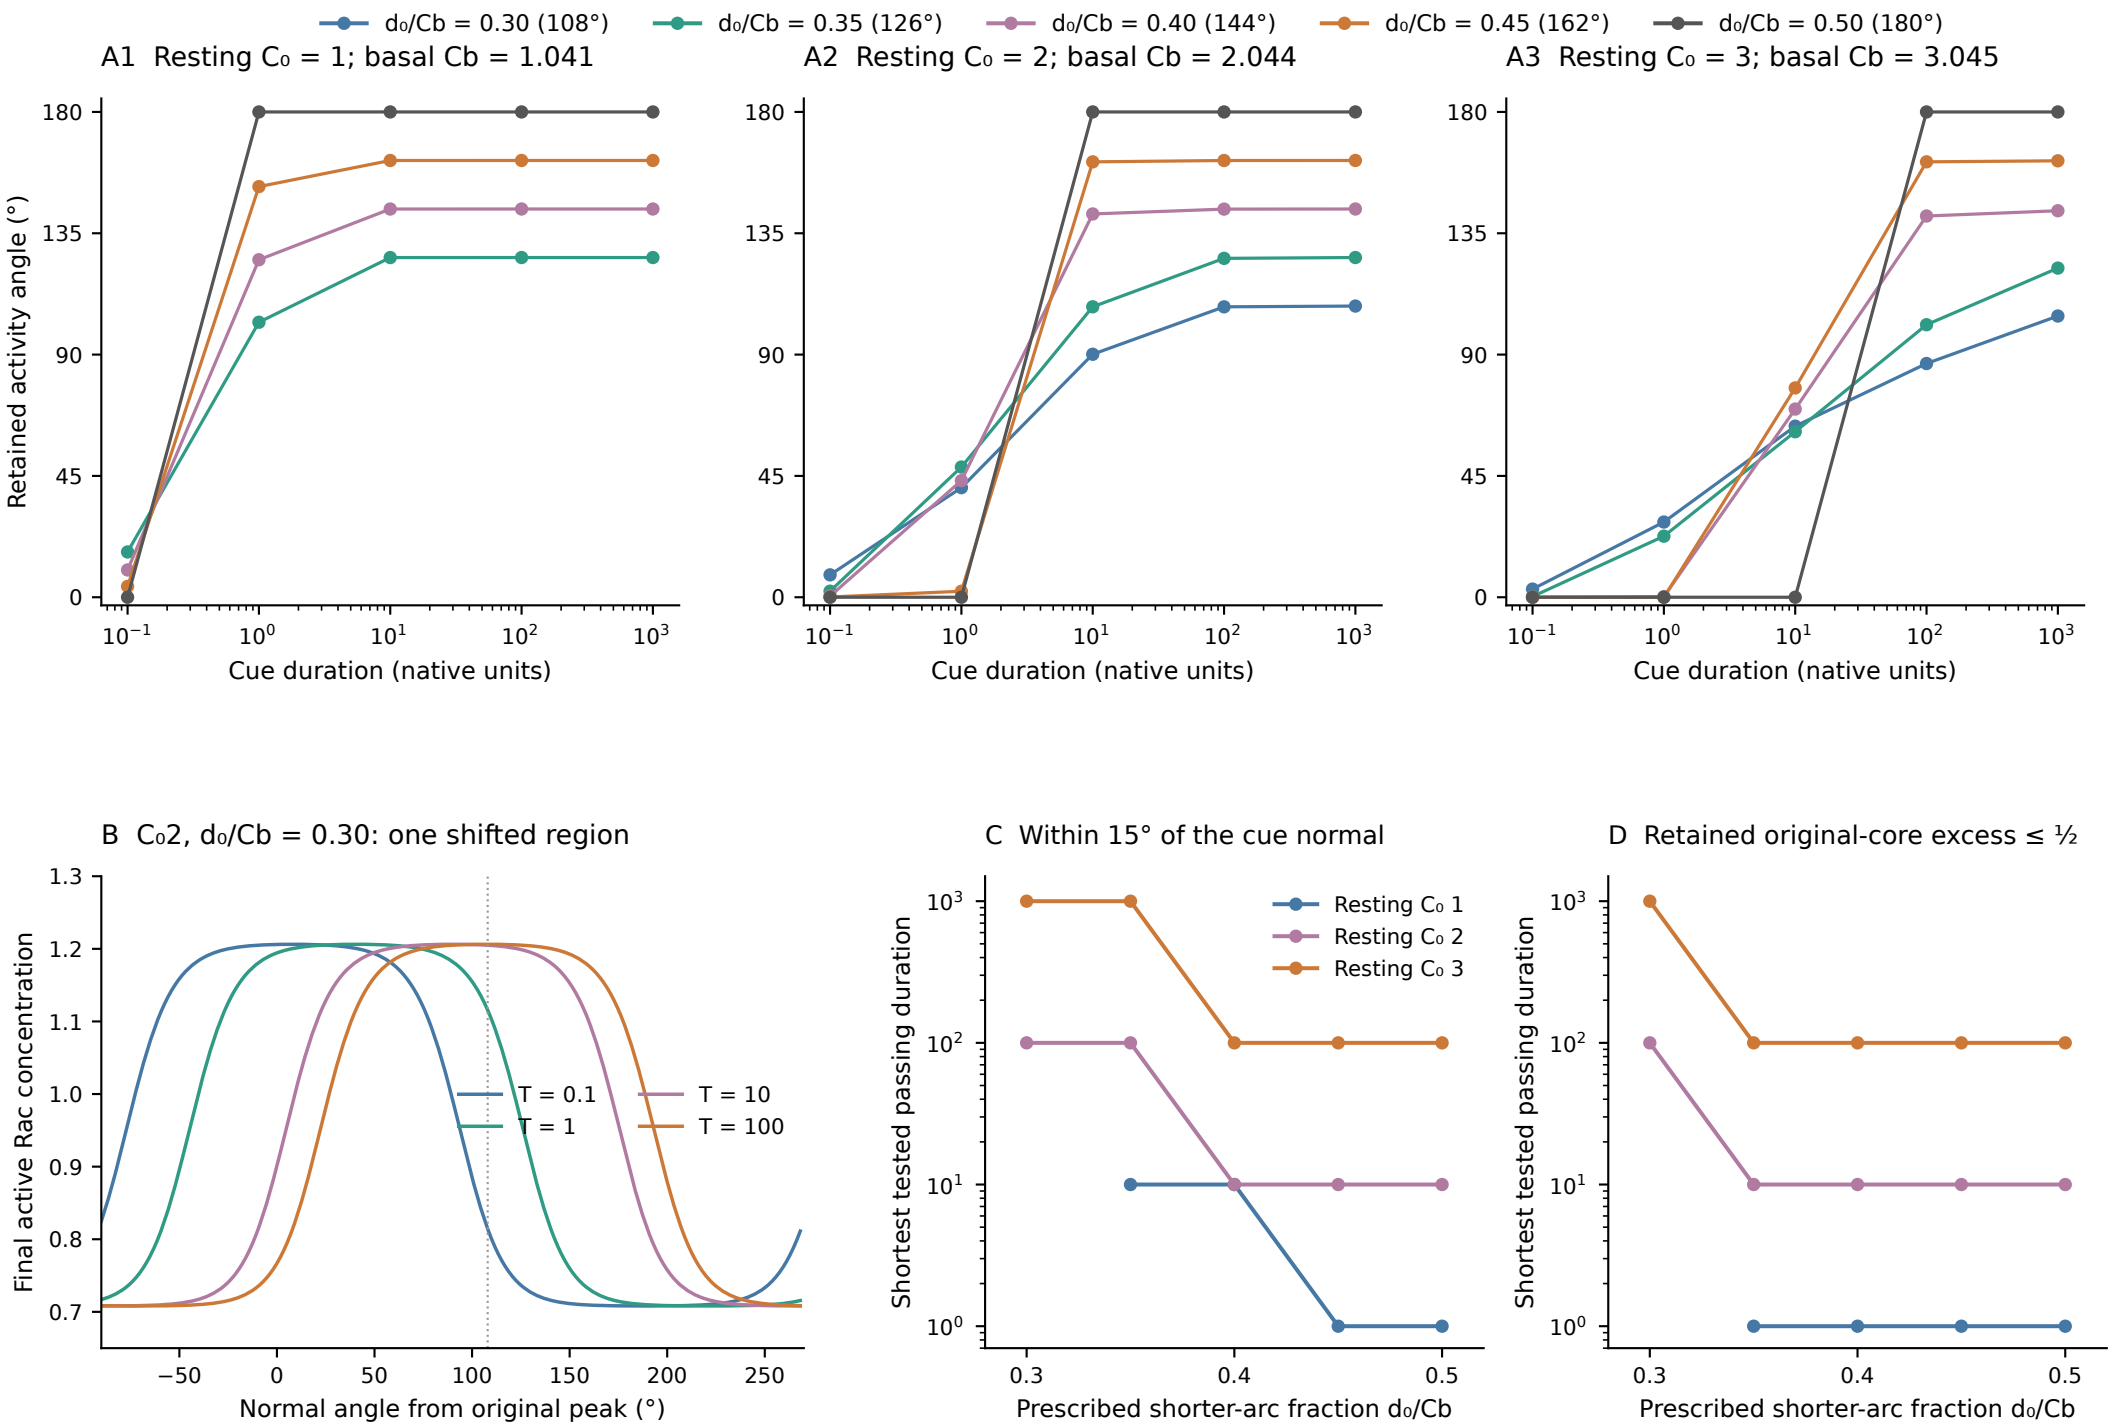
Figure 3 continued · Finite cues produce graded retained reorientation on Spring rings



All readouts follow 13,000 cue-free units. Fixed peak 4 and full instantaneous physical support 0.2; exact shared basals.
70 complete branches; C₀1/f0.30 excluded for initial overlap. All final fields pass finite-window stationarity and contain one resolved peak.

A continuous activity angle is an observed spatial-field readout, without a cell-velocity law. Points in C/D are tested durations, not refined minimum thresholds.
