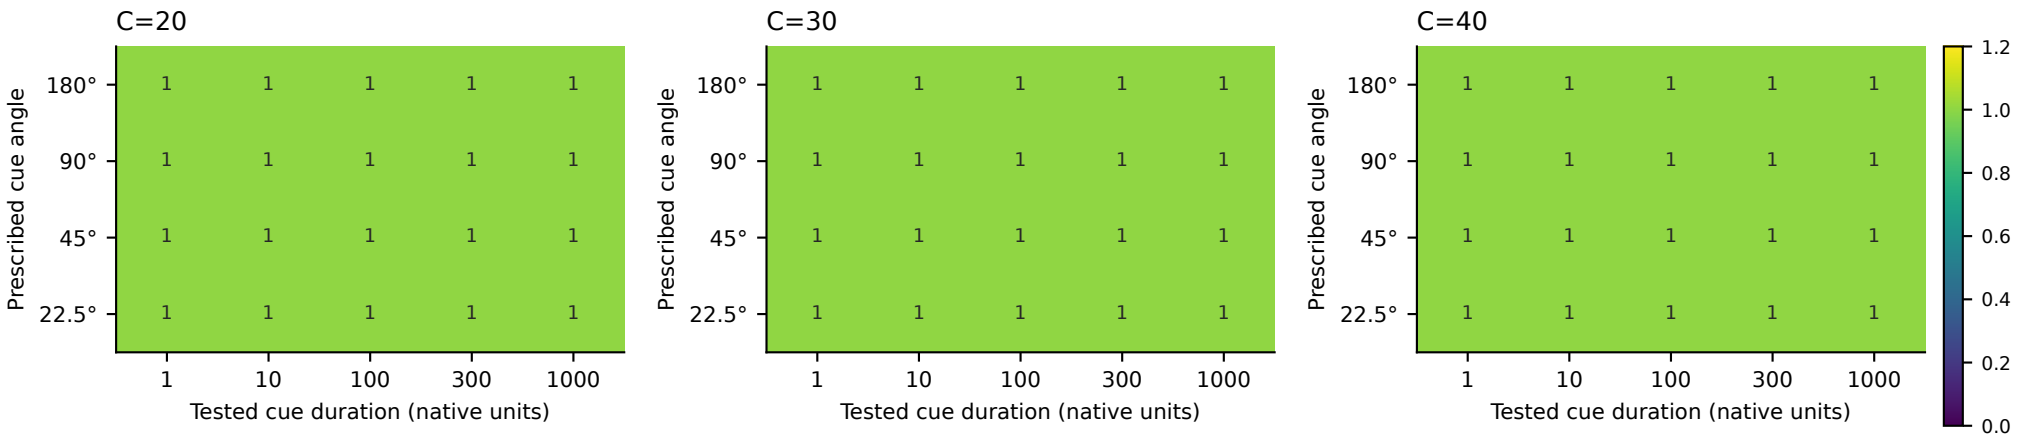
Wave-pinning · magnitude, amount and fixed-region response

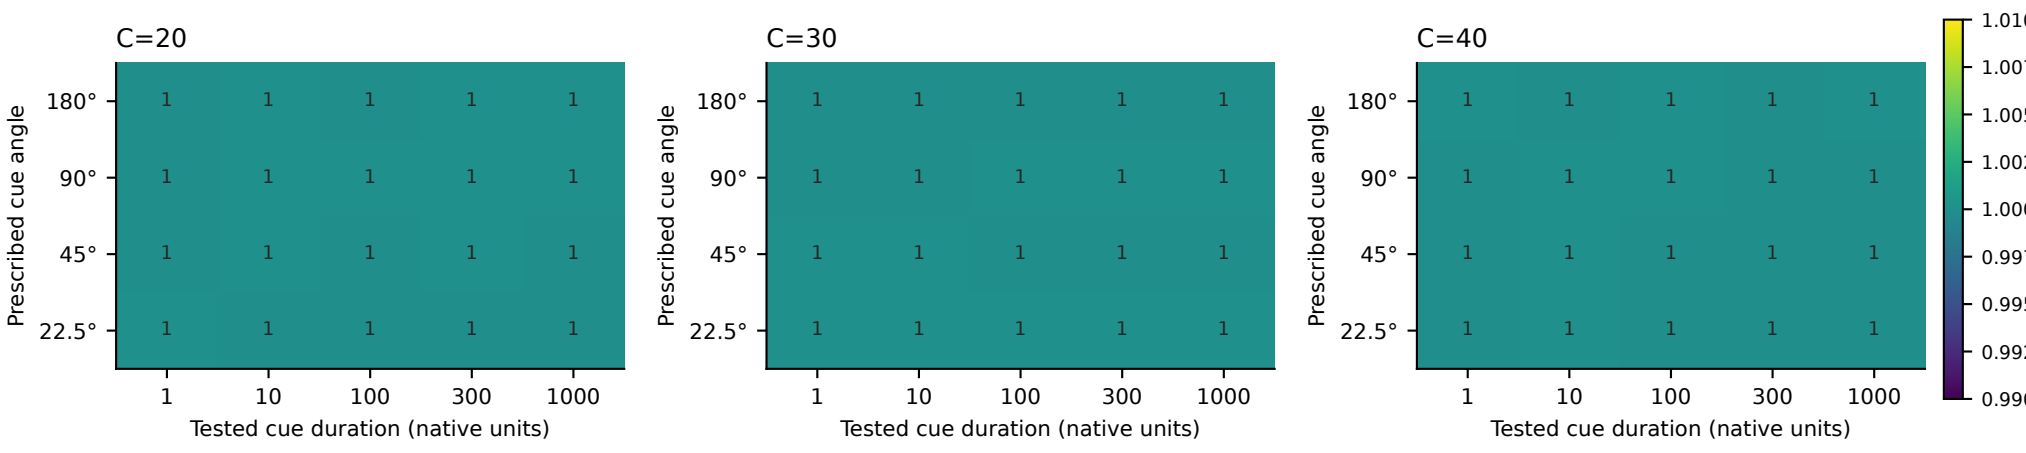
All angles and sizes, same native histories. Extrema are sampled values; envelopes/cells are not independent-seed uncertainty.

The original basal region is a fixed material interval. Depletion/rebound can reflect translation or redistribution and does not establish site lineage.

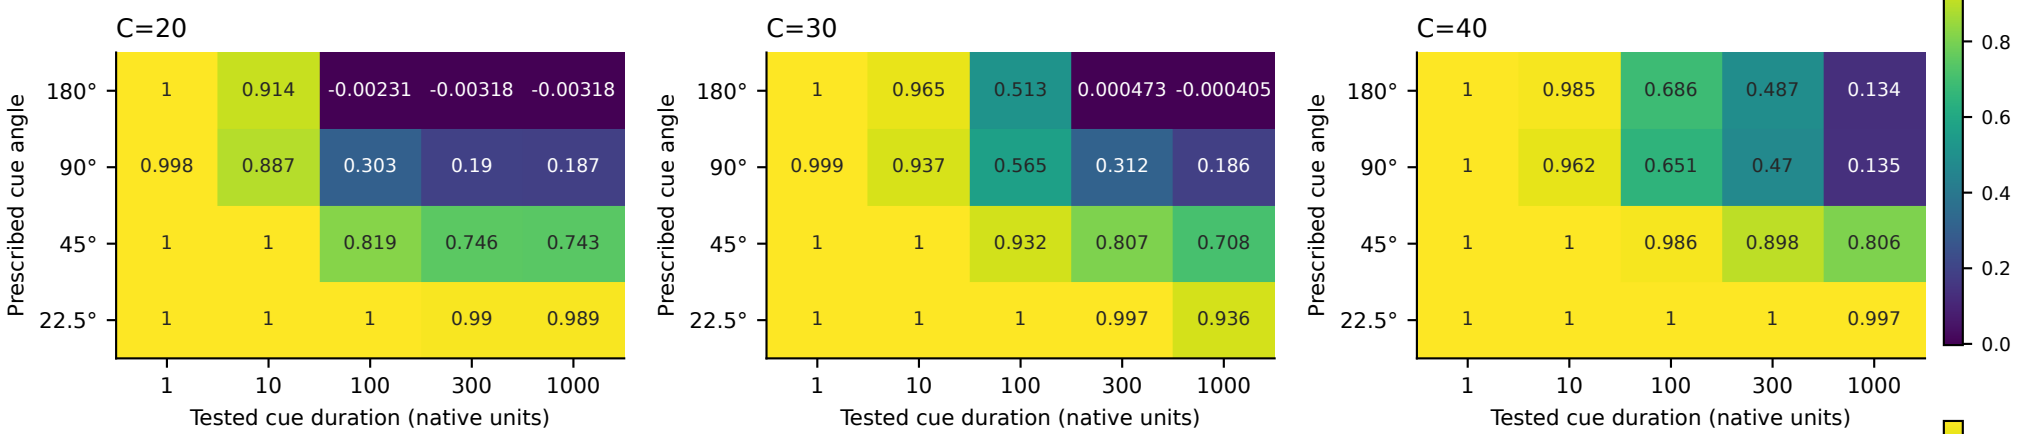
Final relative resultant R



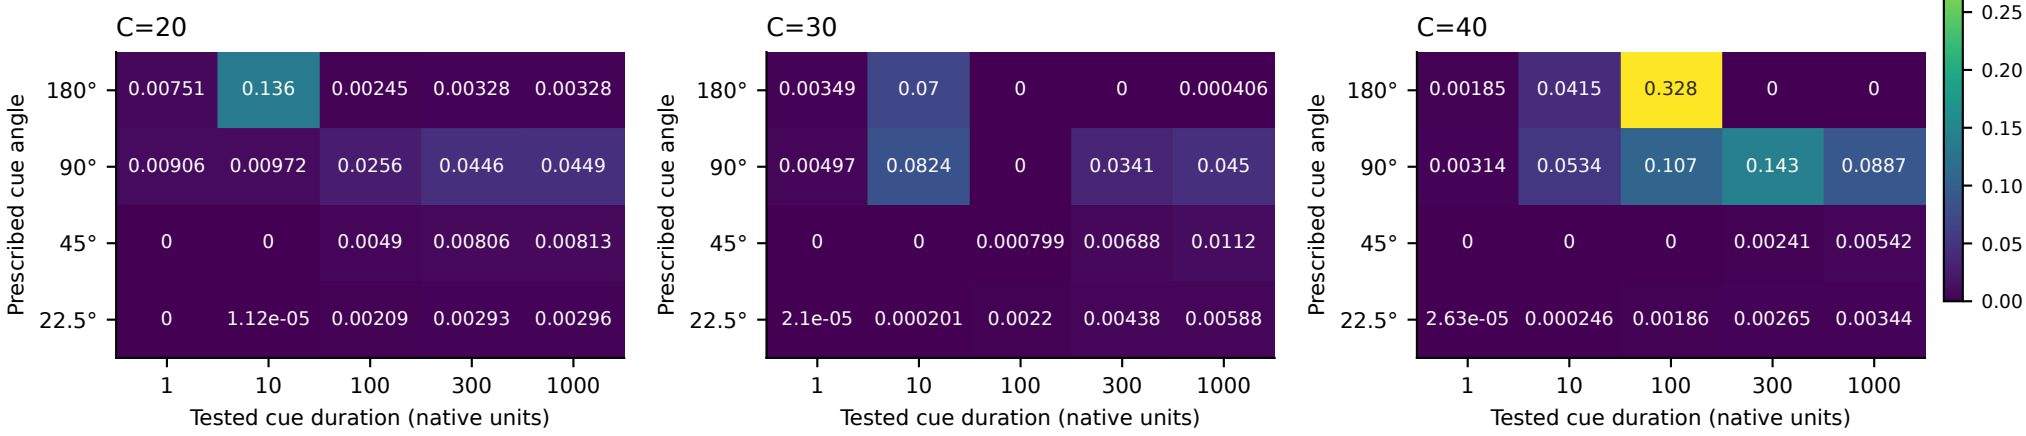
Final total active amount $M_0/M_0(0)$



Cue-on sampled original-region minimum



Final regional excess minus sampled minimum



Analyzed histories 240/240 · generated 2026-10-19T16:41:10.791970+00:00 · complete grid · native clocks differ across models
