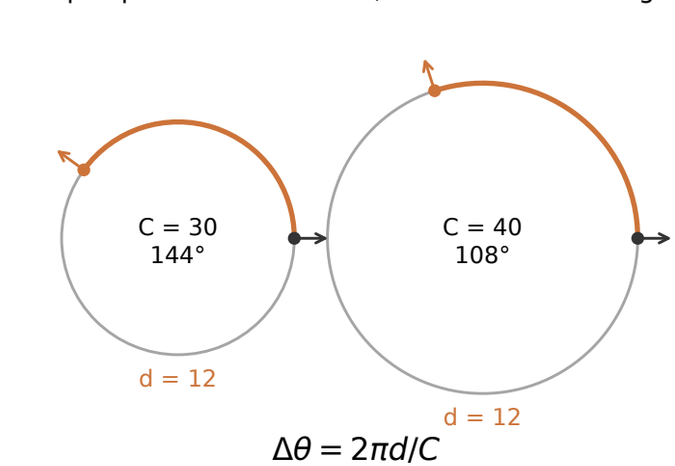

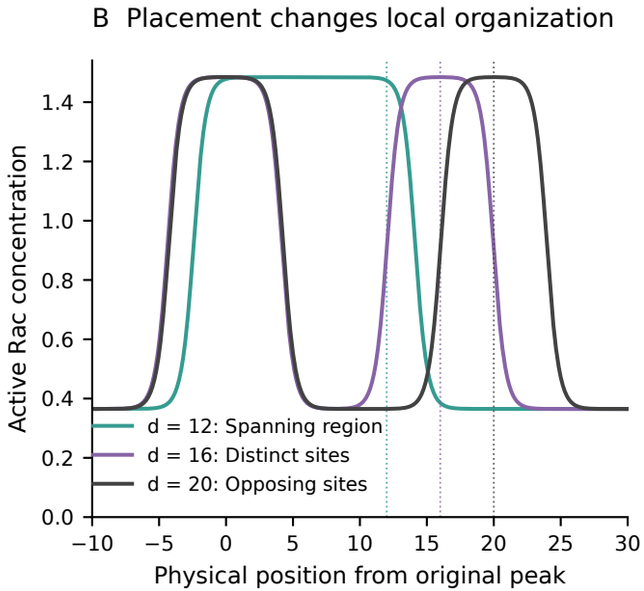

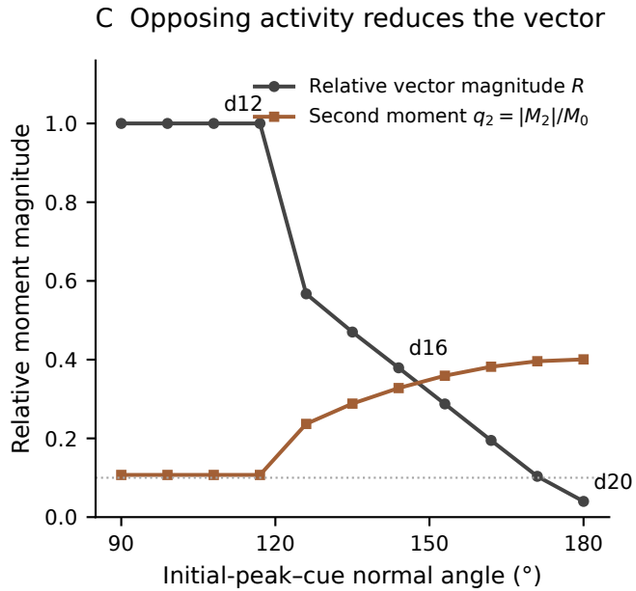

Figure 3 · Geometry connects local polarity organization to an activity vector

A larger perimeter converts the same physical separation into a smaller angular separation.

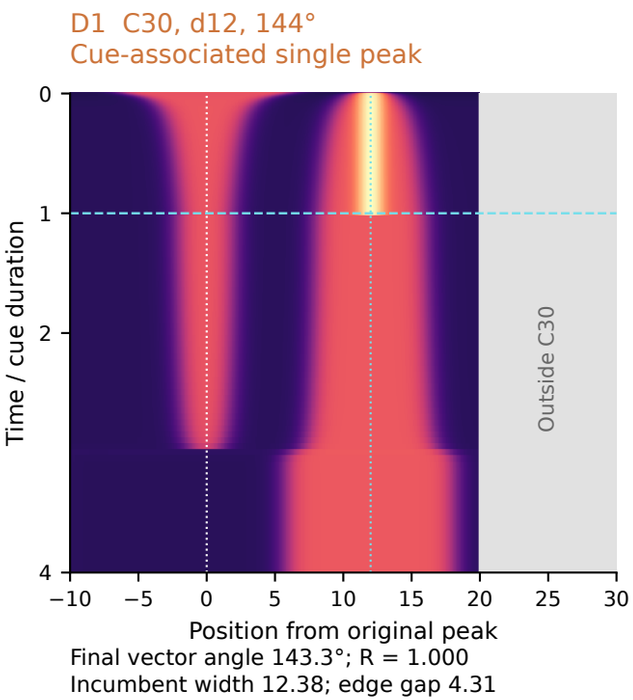

Holmes C40 · d: initial peak to cue centre
Readout: 13,000 cue-free units

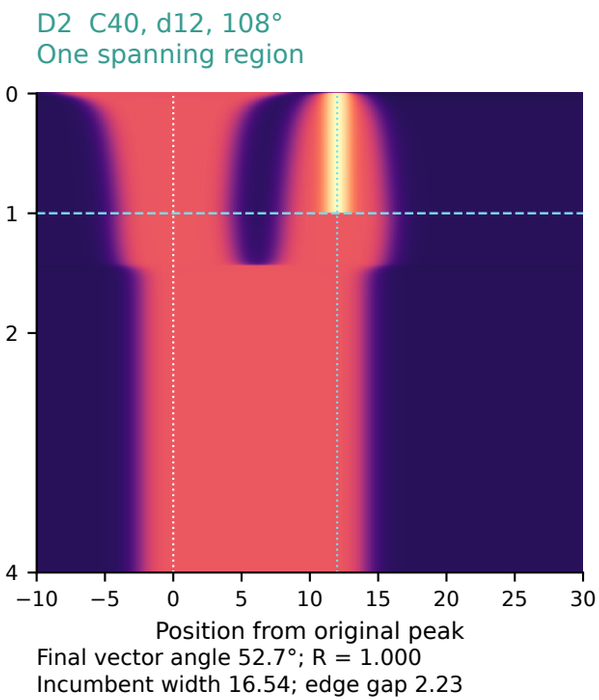

At 180°: two local peaks, R = 0.040
Direction masked below R = 0.1

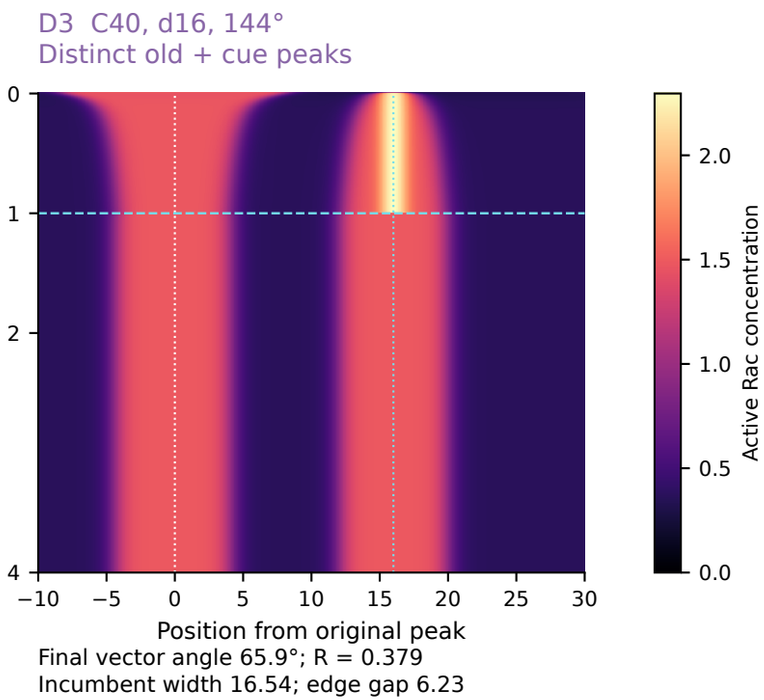

The same physical distance or the same angle can accompany different native pattern fates.

Final vector angle 143.3°; R = 1.000
Incumbent width 12.38; edge gap 4.31

Final vector angle 52.7°; R = 1.000
Incumbent width 16.54; edge gap 2.23

Final vector angle 65.9°; R = 0.379
Incumbent width 16.54; edge gap 6.23

Native Holmes histories · cue 0–1000 (cyan withdrawal), fixed full support 3 and peak 1. Field display ends at 4000; final readout is 14000.
Activity vectors describe spatial activity, without assuming a cell-movement law. Complete maps and descriptor tests are linked in the evidence.
