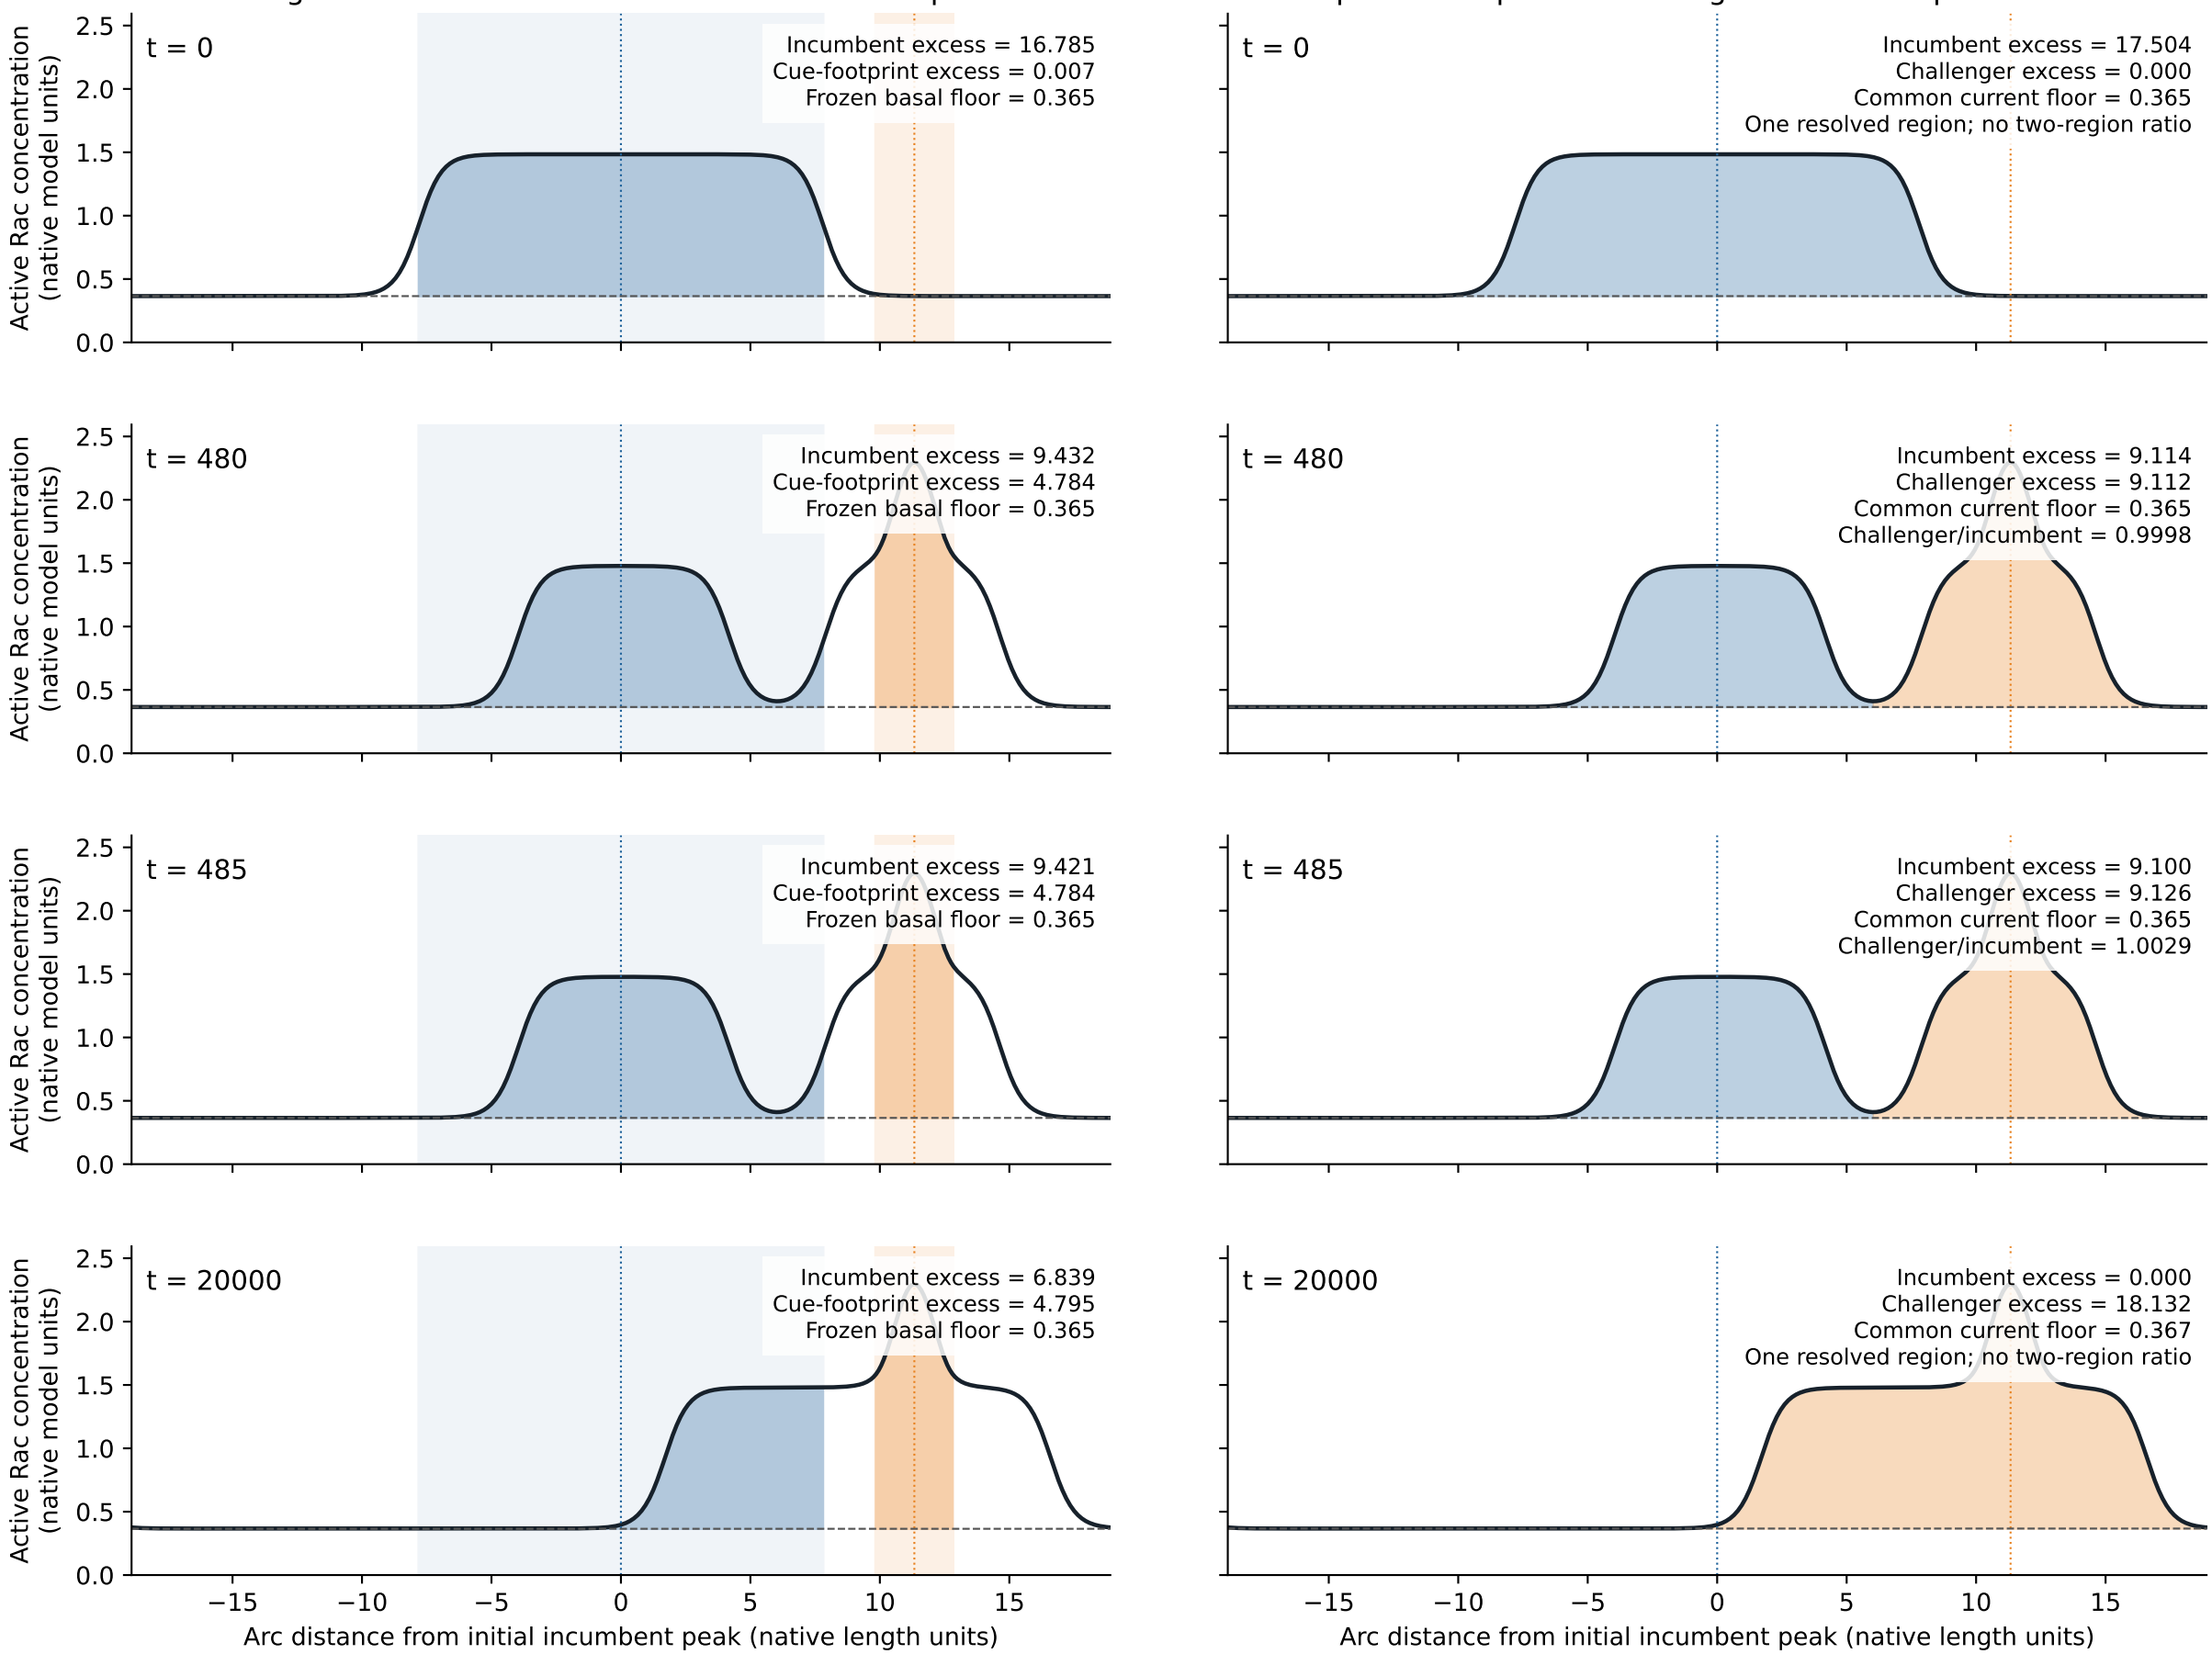

Figure 3 measurement decision — identical native profiles, different counting windows
Holmes 3, circumference 37.8, external edge gap 1; native cue held continuously

Blue: incumbent-associated activity. Orange: challenger-associated activity. Dashed line: subtracted background.
Original handover is unobserved by 20,000; proposed two-region excess handover lies in saved bracket [480, 485].
Amounts integrate active Rac above background (concentration × length); basin boundaries use a continuous subcell saddle fit.
